

## **From Tek-Tip Forum**

### **Release 11.0.4.1 - 400 Bad Request**

**I have just done 2 of these and both failed to load all the files correctly.  
This is a known issue with Avaya.**

**Per Avaya**

**You can either upgrade by following the Upgrade process of recreating the SD card,  
or you can delete the file listed below.**

**C:\Program Files (x86)\Avaya\IP  
Office\Manager\MemoryCards\Common\system\primary\WebMgmtEE\Version.json**

**Then go back into file embedded file management and upgrade system files again.**
